

# mydig.py - DNS Resolver

---

External libraries used : dnspython

The external library, dnspython, is used to create and send queries.

Instructions for how to run the program :

mydig.py takes in input from the terminal. The first argument after mydig.py in the terminal will be the website (domain name) that will be resolved.

An example input : `python mydig.py domain_name`

The argument, `domain_name`, would be resolved within the program.
